

# Cognition-Enabled Transferable Embodied AI

Prof. Dr. Michael Beetz

AICOR Institute for Artificial Intelligence, University of Bremen

Prof. Dr. Rudolph Triebel

Leader of Dep. for Perception and Cognition, Robotics Institute, DLR

Professor for Intelligent Robot Perception, KIT

# Motivation

# Perception for Robotic Manipulation

## Object detection

- often involves segmentation + feature extraction
- adds *semantic* information
- is a *classification* problem
- requires the appearance (color, texture) of objects

# Perception for Robotic Manipulation

Object detection

Object pose estimation

- retrieves the exact position and orientation in the camera (robot) frame
- is a *regression* problem
- *requires the exact geometry of objects* **really?**

Ulmer, Durner, Sundermeyer, Stoiber, Triebel, “6D Object Pose Estimation from Approximate 3D Models for Orbital Robotics”, IROS 2023

# Perception for Robotic Manipulation

Object detection

Object pose estimation

Grasp detection

- finds the pose of the robotic gripper for a grasp
- is a *regression* problem
- requires the exact geometry and kinematics of the gripper

# What are the Main Problems?

## “Inverse” Problems

- find a plausible cause for a given effect
- e.g.: object detection, grasp detection

## Open-world Assumption

- unknown objects can always appear
- distinguish the known from the unknown

## From the Lab to the Kitchen (Part I)

Simulated training data

Object pose estimation  
in the lab

Objects and obstacles  
in the real environment

Grasping in the wild

## From the Lab ... (Part II)

distance maps by RGB-D

grasp predictions by Contact-GraspNet

Cluttered scene

# Virtual Research Building

# Transfer to real world scenarios

Image

Object detection

Pose estimation

$$\mathbf{x}_w = R\mathbf{x}_o + \mathbf{t}$$

Standard  
pipeline

Direct grasp  
detection

Metallic objects

Are all objects  
of known class and known  
shape?

Functional grasping?

Are all objects of  
some known shape?

Infer object shape  
from training data

Is there unknown  
background?

Treat known and  
unknown objects  
differently

yes

no
